

How Emerging Biopharma Can Launch and Scale Content Faster

Four best practices to creating a commercial content foundation from medical, legal and regulatory (MLR) review to delivery across channels

The rapid creation, review, and approval of promotional assets can be a key competitive advantage for pre-commercial companies. The quality of the foundation you lay for your content workflow now, including the medical, legal, and regulatory (MLR) review process, will help your company to secure that competitive edge and scale more efficiently in the future.

One of the unexpected benefits of healthcare professional (HCP) engagement going digital was the opportunity for reps to spend more quality time with doctors.

Virtual meetings extended the amount of time HCPs were able to meet with reps from an average of three minutes to 19 minutes, when compared to traditional, face-to-face meetings.

Rep-sent email also drove significant engagement, with an average open rate of 36%.

While the chance to engage in more meaningful conversation has certainly been a positive thing for field teams, it's also created a greater need for marketers to produce more content, faster. Establishing the right content model early on is key for emerging biopharma companies looking to enable and sustain rapid content creation at scale.

The first step is to clearly outline how your organization will manage its assets through each stage of the content lifecycle. From creation, review, and approval, to distribution and delivery, think about how your content will ultimately make its way to the hands of doctors and patients in the most efficient—and compliant—way possible. The following best practices can help get the ball rolling and ensure that you're building a long-term content foundation that can scale with your business.

“We wanted a system that was suitable for every country but didn't have to be overly customized. Vault PromoMats gives us the global collaboration and automated audit trails we need, while gaining the flexibility to adapt to edge cases as they arise.”

— Agnès Keltie, Norgine

1 Establish a single source of truth for all content stakeholders

Before the content creation process begins, your commercial team and agency partners will want to establish a comprehensive launch strategy as far in advance as possible. This strategy should include a content plan with key assets to be created, as well as early concepts that they can share with the medical, legal, and regulatory (MLR) review team before content development begins. Ensuring all stakeholders are working and commenting on the same content will reduce inefficiencies and accelerate content to market.

Make sure that anticipated launch dates are continuously communicated so the marketing team has enough time to include an initial round of concept review ahead of content creation. Not only will this help reduce the number of iterations and review cycles the team has to go through later on, but it will ensure final assets are approved and ready to go as soon as your product has been cleared by regulatory authorities.

2 Fast-track MLR reviews with automation

Once content plans are approved and assets are drafted, the next phase of the content lifecycle is review and approval. Marketing will need to route all assets to necessary stakeholders to ensure that they are compliant and ready for distribution—a process that can quickly become complicated.

Email and spreadsheets are often a starting point for emerging companies. However, they need to be managed and manually updated constantly, making it easy to lose track of where assets are in the review process. The result is a loss of precious time and money, as well as an increase in compliance risk.

A simpler and more sustainable option is to automate these cycles through a cloud-based MLR review system. With review and approval being tracked in one place, stakeholders will have an easier time managing approval queues while also gaining visibility into what's coming down the pipeline. Meanwhile, marketing and commercial operations teams will be quickly able to spot any bottlenecks in the process and ensure that assets are not only approved but submitted to the appropriate regulatory bodies in a timely manner.

“To deliver great customer experiences with content, we should be able to provide what the customer wants when they want it, and where they want it. We have set out to replace the traditional ‘push to consumer’ content model with a customer-centric engagement one.”

— Mubasher Hassan, Grünenthal

Optimize channel mix for maximum impact

After content has been approved, it's now time for the commercial team to educate the market with brand-compliant messaging and materials. The volume of your content will only grow as it gets pushed through more channels across multiple audiences, so make sure the team has an easy way to manage channel content distribution and delivery.

In addition to in-person meetings, consider a variety of digital channels such as your website, social media, newsletters, webinars, and even an online event to distribute content. Most cloud-based content management solutions will let you create, approve, and distribute content all from the same platform, while also helping with content withdrawal when needed.

Label changes or new drug studies will require rapid updates to all promotional and medical content, typically within a three- to six-month timeframe. To avoid being penalized, make sure you have visibility into all content and all channels that the assets are being distributed from. Leverage your content system to ensure that only approved materials make it out to market and maintain control of assets with instant withdrawal, controlled updates, and automatic expiration.

4 Measure performance and adjust content strategy as needed

Getting your content in the hands of your customer is a great milestone, but it's not the final step. The marketing team will need to understand which materials are resonating with your audience and through which channels, whether that's patients on your website or doctors in an office.

Measure customer reaction to and engagement with assets using tools like tracking links, social metrics, and content sentiment, all of which should flow back into and inform your centralized content strategy. It's also a good idea for reps to ask for feedback directly, especially when meeting with HCPs in person.

Once you gather data on asset performance, you can analyze your results and use these findings to adjust your marketing tactics moving forward.

Planning for the future

The rapid creation and management of promotional and medical assets is a key competitive advantage for pre-commercial companies. The efficiencies you build into your content workflow now will help your company scale more efficiently using new approaches like modular content, now or in the future.

A modular content approach reassembles existing, pre-approved content blocks, or modules, into a variety of assets that can be used in different channels and regions. It can be particularly useful for fast-tracking content creation and approval, in addition to achieving the ultimate goal of personalized content.

“My advice to companies looking for a commercial content solution is, set it up early, and leverage all the best practices so you can hit the ground running and have a scalable solution for the future.”

— Darran White, Upsher-Smith Laboratories
